Overview

Jenkins has a **powerful extension and plugin system** that allows developers to write plugins affecting nearly every aspect of Jenkins' behaviour.

Even a large part of the "core" functionality of Jenkins uses plugins, with some of the most popular ones being installed on set-up (should you choose to "install suggested plugins").

Why Plugins?

Some of the reasons why we might want to use plugins include:

- Source Code Management (SCM) implementations:** integrating SCMs like Git into Jenkins.
- Build steps:** providing everything from a convenient UI to configure build tools, to sending emails post-build.
- Authentication realms:** integrating Jenkins with Single Sign-On systems, or external user directories (such as Azure Active Directory).

And much, much more!

Tutorial

In this tutorial, we will look at installing a plug in, and seeing what effect that has on our Jenkins instance.

Before starting this tutorial, make sure you have a Jenkins instance up and running.

- Go to **Manage Jenkins** and click on **Manage Plugins**:

Manage Jenkins

System Configuration

**Configure System**
Configure global settings and paths.

**Global Tool Configuration**
Configure tools, their locations and automatic installers.

**Manage Plugins**
Add, remove, disable or enable plugins that can extend the functionality of Jenkins.

**Manage Nodes and Clouds**
Add, remove, control and monitor the various nodes that Jenkins runs jobs on.

- Click on the Available Tab and search "maven". Check **Maven Integration** and select **Install without restart**:

Jenkins Pipeline

Markdown

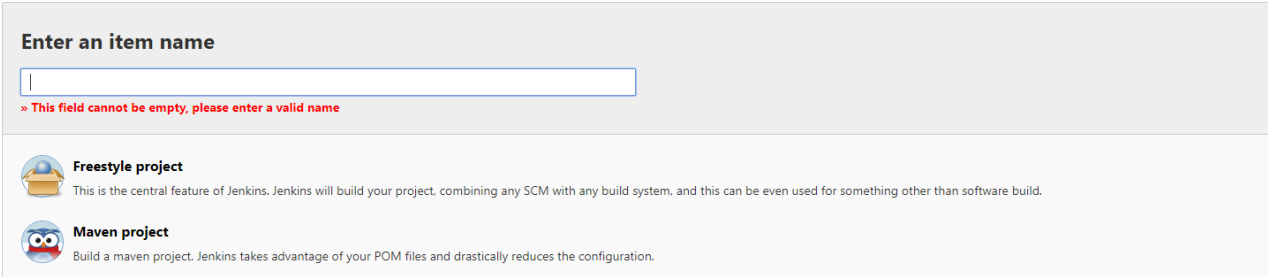

IDE Cheatsheet

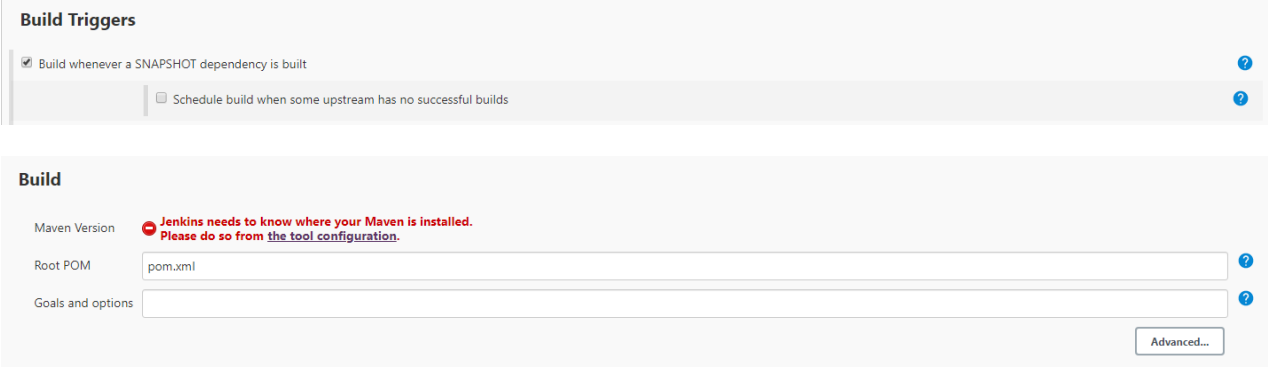

3. In **Manage Jenkins** > **Global Tool Configuration**, you will now see an option to configure the path to the Maven file:

4. If you create a **New item**, you can now see the **Maven project** option:

5. Inside this project, there are some options available that make integrating with Maven much easier:

The Maven plugin we installed allows much easier integration with Maven, and makes it simple to configure; this is the power of plugins!

To uninstall a plugin, you simply go back to **Manage Plugins** and go to the **Installed** tab:

Exercises

Take a look at this [link](#) to browse the available plugins for Jenkins.
